

Managing Environmental Flows Information

Eric S. Hersh and David R. Maidment

The University of Texas at Austin

Center for Research in Water Resources

May 19, 2010

EWRI

Executive Summary

- Lots of data, poorly organized and minimally accessible
- A suite of tools and systems is emerging for physical and chemical water data from CUAHSI and others
- This work seeks to extend these systems by adding biological water data to the discussion in a step toward full integration

Outline

- Background
- An Environmental Flows Information System for Texas
- Hydroinformatics for Freshwater and Marine Biota
- Conclusion

Outline

- *Background*
- An Environmental Flows Information System for Texas

- Conclusion

Motivation

“The State should be encouraged to mount a comprehensive review and digitization project to recover all of this data and make it available to stream ecologists and other scientists.”

-Science Advisory Committee (2004)

“All available data and study reports related to the hydrologic, biologic, geomorphic, water quality, and connectivity of the study area will be assembled.”

-Texas Instream Flow Studies: Technical Overview (2008)

Problem Statement

“It is clear from this BBEST’s report that the collaborative process envisioned in SB3, designed to achieve a consensus, broke down.”

-SAC Review Memo, 3/17/2010

- Trinity/San Jacinto/Galveston BBEST unable to reach consensus, largely attributed to a fine-scale analysis of hydrology with little or no connection to the aquatic biology of the basin and bay system

“**Cyberinfrastructure** refers to infrastructure based upon distributed computer, information and communication technology. If **infrastructure** is required for an **industrial economy**, then we could say that **cyberinfrastructure** is required for a **knowledge economy**.”

*-2003 NSF Blue-Ribbon Advisory Panel
on Cyber infrastructure*

Informatics — the science of information, the practice of information processing, and the engineering of information systems

Hydroinformatics — the study of the flow of information related to the flow of water (and the entire water environment in general)

Instream Flows

Thom Hardy, Texas State University

Water left in a river system, often for managing some aspect of its condition

Instream Flows is the art and science of collecting data in systems we cannot adequately sample using methods developed by committees of technically unqualified participants for organisms we know very little about in order to form concepts about processes we do not fully understand that we represent as mathematical abstractions that we cannot precisely analyze to determine their responses to indeterminate stresses we cannot accurately predict now let alone in the future all in such a way that society at large is given no reason to suspect the extent of our ignorance.

- Background
- *An Environmental Flows Information System for Texas*
- Hydroinformatics for Freshwater and Marine Biota
- Conclusion

An Environmental Flows Information System for Texas

- **Six information types:**

- Point observations data (eg: WaterML/ODM)
- Geographic (shapefile, feature class, KML, WFS/etc)
- Documents (DSpace digital archive)
- Tables (conservation status, guilds)
- Tools (CALF, TSA, HydroExcel)
- Links (Fishes of Texas, IHA, SAC)

- **Four access types:**

- Web Page
- Interactive Map Viewer
- Digital Library
- HydroPortal

Done

CUAHSI Hydrologic Information System

- 43 observation networks
- 15,000 variables
- 1.8 million sites
- 4.3 billion data values

Mission:

To enhance hydrologic science by facilitating user access to more and better data for testing hypotheses and analyzing hydrologic processes

Mission: to be a **centralized, online location** for the research and works of university and other water resource entities in Texas, **effectively federating water research** currently housed at several universities across Texas

Prototype at: <https://repositories.tdl.org/twdl-ir/>

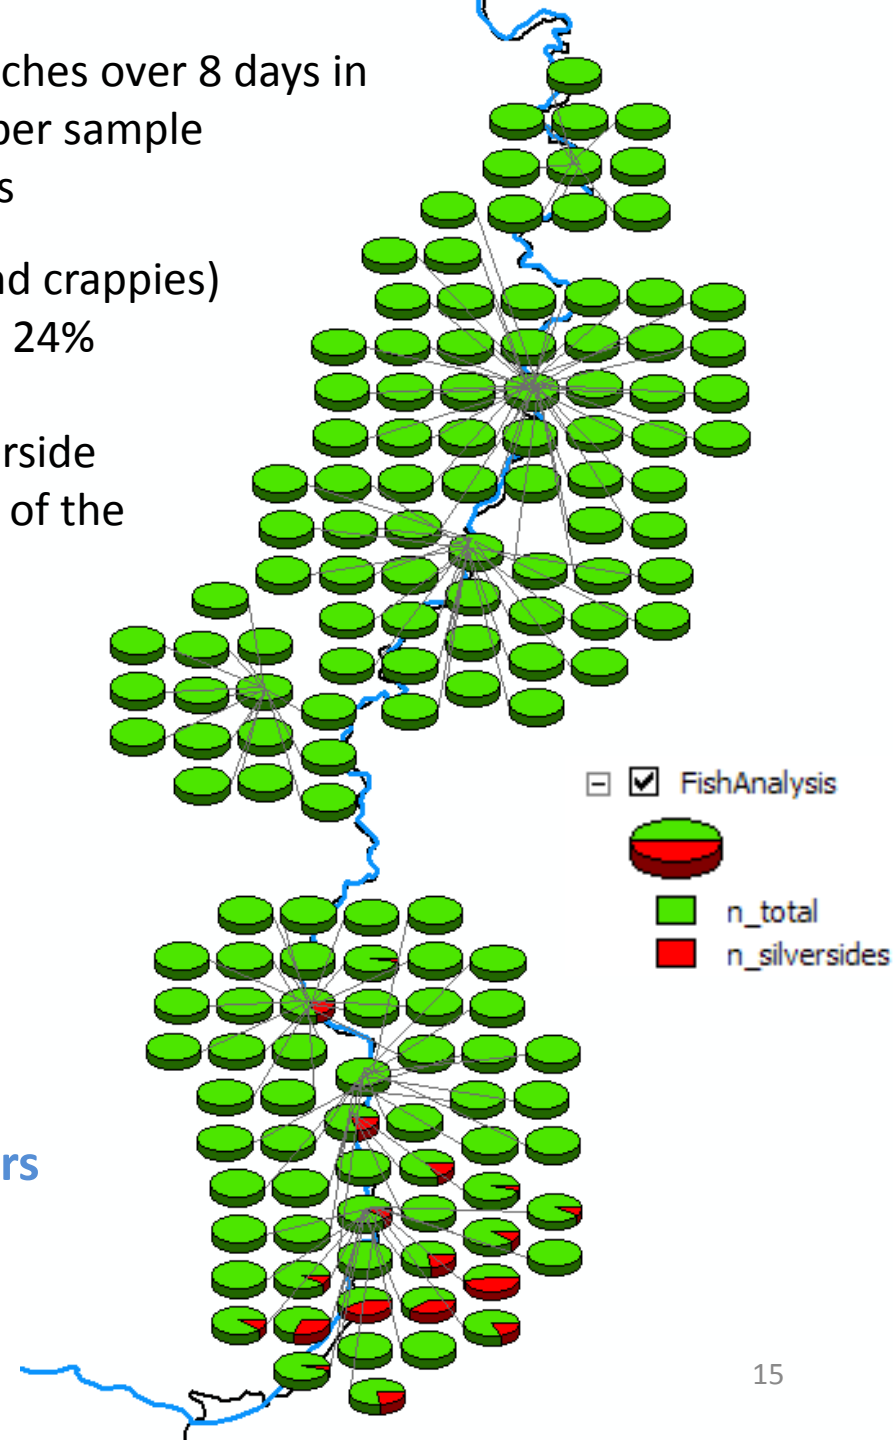

-Sabine River: 165 samples collected at 8 study reaches over 8 days in 2006; 147 samples yielded fish, averaging 40 fish per sample
-5,811 fish were observed, representing 58 species

-Across all sites, 889 *Centrarchids* (sunfish, bass, and crappies) were observed with a relative abundance of $22\% \pm 24\%$

-The only non-native observed was the inland silverside (*Menidia beryllina*). 192 total, ranging from 0-90% of the sample population with a mean of $3\% \pm 12\%$

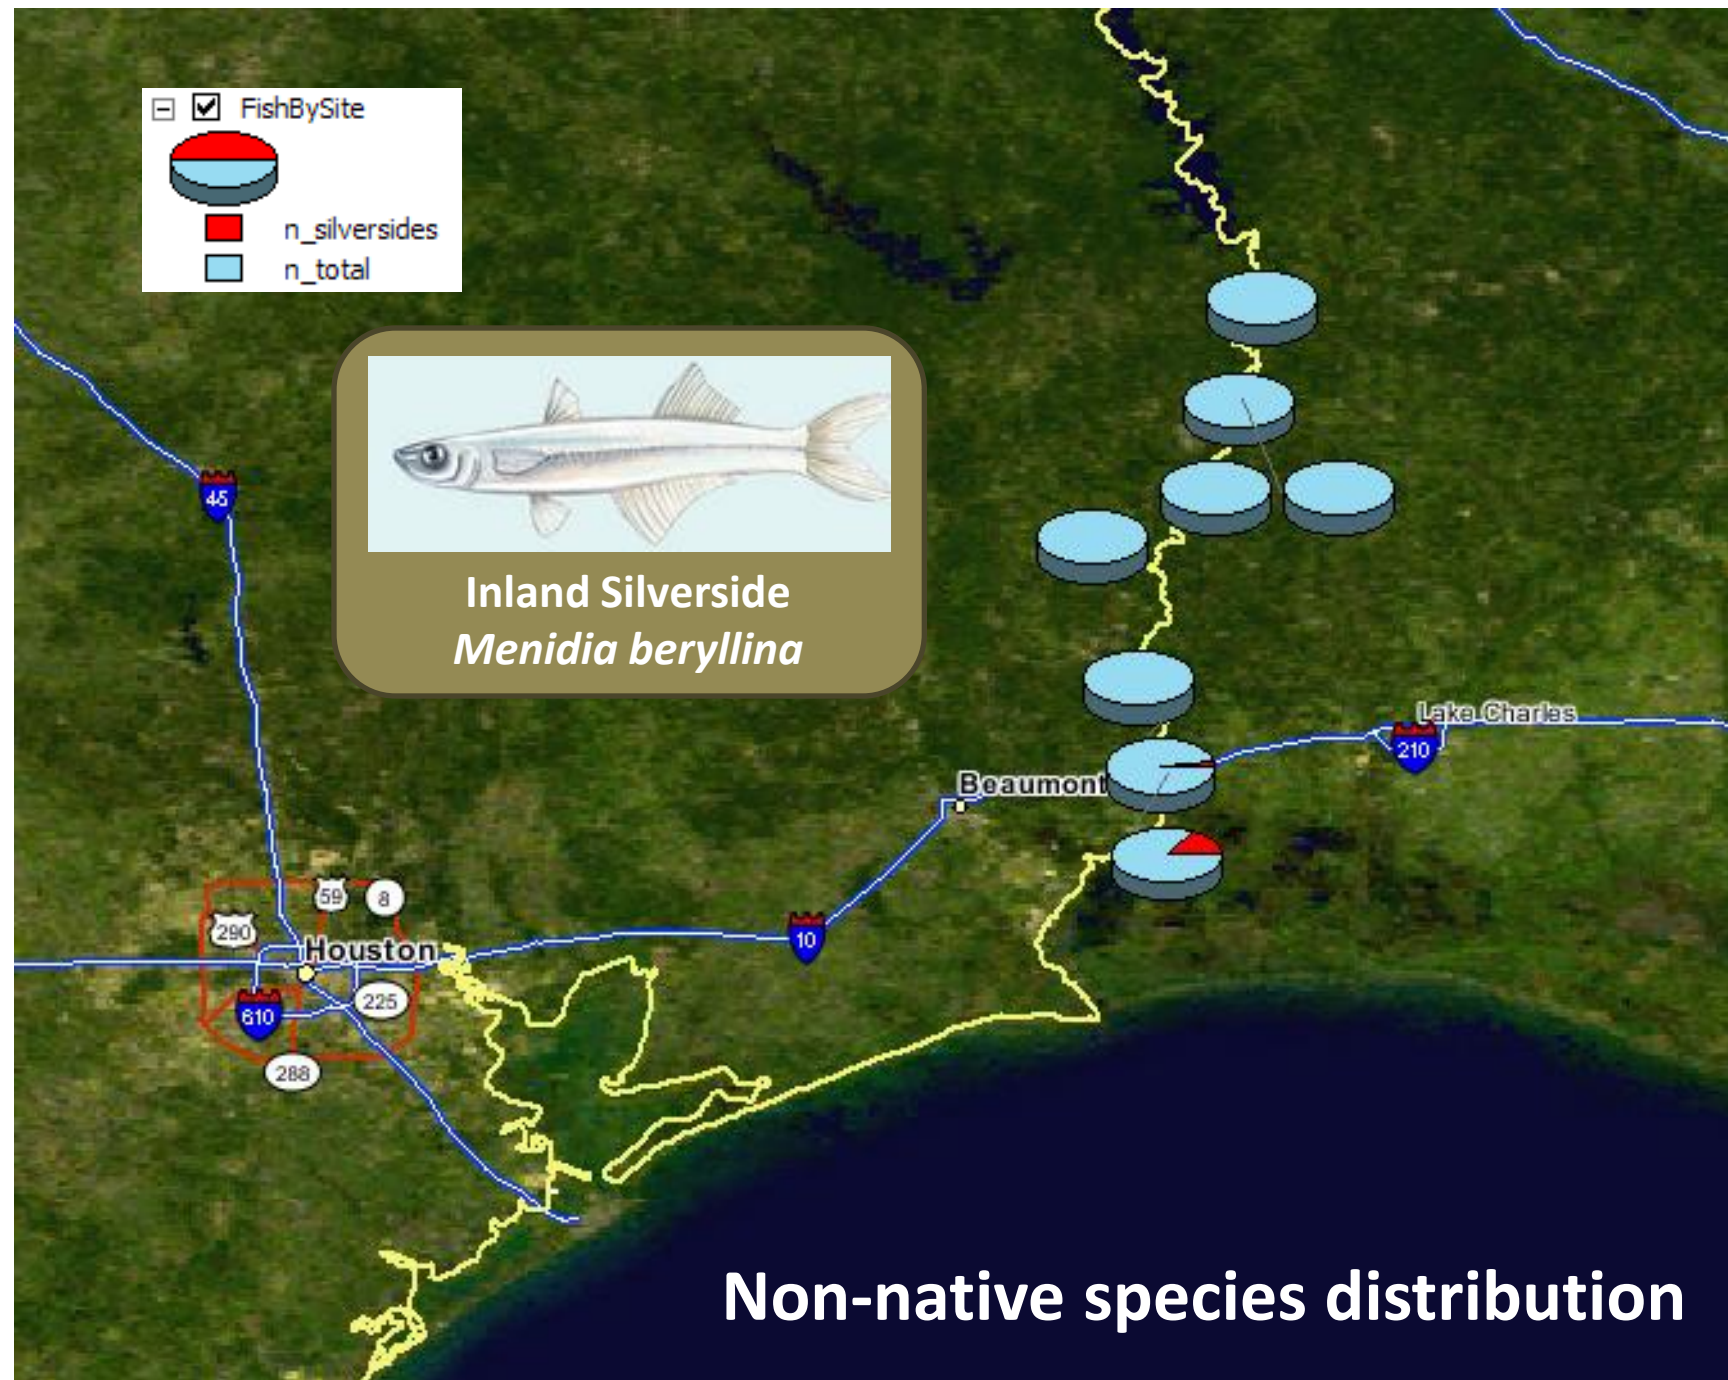

Distribution: Originally found in **coastal waters and upstream in coastal streams** along the Atlantic and Gulf coasts

Inland Silverside
Menidia beryllina

Non-native species distribution

The Water Environment

- Distinct types of water data, each with its own character
 - Physical data describe the movement of water and its properties
 - Chemical data describe the constituents moving with, in, and through the water
 - Biological data describe the organisms inhabiting the water environment.

Ontologies & Semantic Mediation

eg: 'reservoir inflow'
vs. 'streamflow'

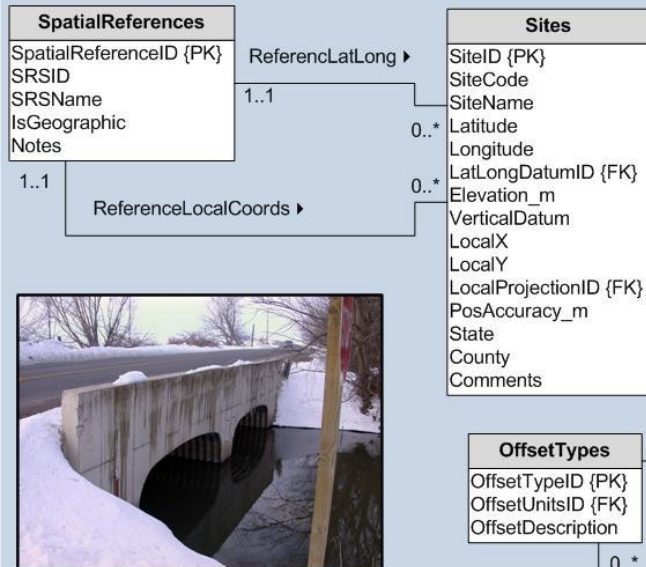

Category	Records		Code	
	Count	% of TRACS	Count	% of TRACS
TRACS SWQM	7,591,675	100.00%	4,412	100.0%
Site and Sample	184,935	2.44%	82	1.9%
Benthic Macroinvertebrates	49,402	0.65%	1,323	30.0%
Fish	32,710	0.43%	311	7.0%
Phytoplankton	10,099	0.13%	371	8.4%
Zooplankton	10,344	0.14%	266	6.0%
Nekton (non-fish)	2,942	0.04%	31	0.7%
Macrophytes	449	0.01%	54	1.2%
Total, Biologic Data in TRACS	290,881	3.83%	2,438	55.3%

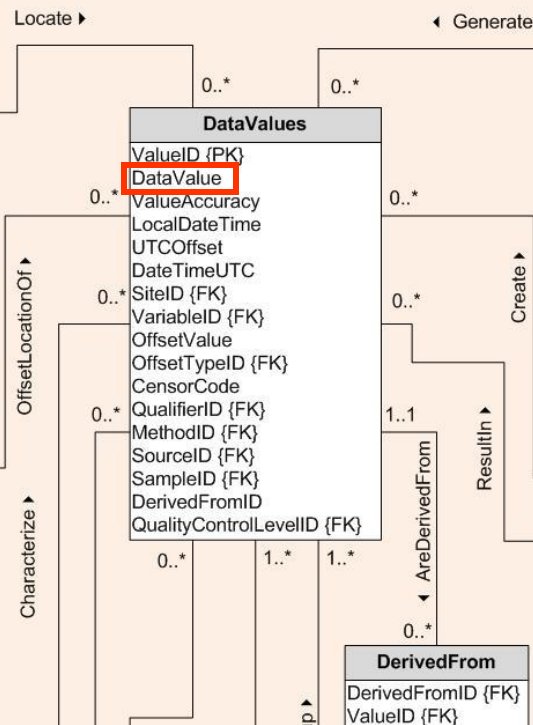

Category	Description
Site and Sample	Including: sampling effort, methods, and equipment; substrate, channel geometry, geomorphology, streamflow, cover, vegetation, watershed, aesthetics, and weather
Benthic Macroinvertebrates	Animals without backbones which live all or part of their lifecycle in or near the bottom of freshwater systems. Including: Platyhelminthes (flatworms), Annelids (worms, leeches), Arthropods (mites, insects, crustaceans), and Mollusks (clams, mussels, snails)
Fish	Vertebrate cold-blooded animals that live their entire lives in water, breathe by means of gills, and move by means of fins (with some exceptions)
Phytoplankton	Microscopic, free-floating or suspended plants and algae which have movement depending on currents and are primary producers
Zooplankton	Microscopic animals capable of movement and are secondary producers. Including: crustaceans and rotifers, diatoms, dinoflagellates, and copepods.
Nekton (non-fish)	Free swimming organisms, exclusive of fish as defined above. Including: Decapods (shrimp, prawns, crayfish, crabs), jellyfish, squid, turtles, frogs, alligators
Macrophytes	Large vascular aquatic plants, growing in or near water that are either emergent, submergent, or floating. Including: cattails, rushes, arrowhead, waterlily
